

Financial Performance Dashboard

Documentation — Logic, Insights & Assumptions

Purpose & Layout

This Power BI dashboard consolidates revenue, profitability, cash flow, and working-capital metrics into a single executive view. It is filterable by Date, Year, Quarter, Month, Region, and Product/Service, and is organized into a KPI summary strip plus five supporting visuals covering trend, budget performance, revenue mix, cash flow, and aging.

Dashboard Logic

- **KPI cards:** Budget Variance % $(-24\%) = (\text{Actual Revenue} - \text{Budgeted Revenue}) / \text{Budgeted Revenue}$, aggregated across the selected period. A negative value signals actual revenue trailing plan.
- Revenue (24M) is total sales for the filtered period; Gross Margin % is Gross Profit / Revenue; EBITDA % is EBITDA / Revenue; Net Cash (688K) is the period's ending cash position after inflows and outflows.
- **Revenue & Profit Trend:** Revenue & Profit Trend plots monthly Revenue against Gross Profit on a dual axis (Revenue ~0.8M–1.2M; Gross Profit ~0.4M–0.5M) to show whether profit is scaling in line with sales.
- **Budget vs Actual:** Budget vs Actual pairs monthly Budget (bars) with actual Revenue (line/markers) so gaps between plan and delivery are visible month by month.
- **Revenue Contribution %:** Revenue Contribution % by Product/Service ranks each line's share of total revenue (Product C 20.8% down to Product A 19.2%), calculated as each item's revenue divided by total revenue.
- **Cash Flow Analysis:** Monthly Cash Flow Analysis is a bridge of Cash Inflow, Cash Outflow, and the resulting Net Cash and Total position, showing how gross movements net down to the period's cash change.
- **Receivables vs Payables Aging:** Receivables vs Payables Aging buckets outstanding balances by age (0–30, 31–60 days), comparing what the business owes (Payables) against what it is owed (Receivables) in each bucket.

Key Insights

- Revenue is under-delivering versus plan by roughly a quarter overall (-24% budget variance), with the Budget vs Actual chart showing actual revenue consistently landing near ~0.9M–1.0M against budgets set near ~1.2M–1.3M in most months — a persistent, not one-off, shortfall.
- Profitability remains healthy despite the revenue miss: a 46% gross margin and 25% EBITDA margin suggest cost discipline is partly offsetting lower top-line delivery.
- Revenue mix is well balanced across five product/service lines (19–21% share each), so the shortfall looks broad-based rather than concentrated in one underperforming line.
- Cash flow is positive but thinning: 2.9M in inflows against 2.2M in outflows nets to roughly 0.7M, well below the 1.4M "Total" reference bar — worth confirming what the Total represents (see assumptions).
- Receivables exceed payables in both aging buckets (11.6M vs 6.4M in 0–30 days; 12.1M vs 5.6M in 31–60 days), and the 31–60 day receivable balance is larger than the 0–30 day one — a potential early sign of slowing collections that merits monitoring alongside the revenue shortfall.

Assumptions & Notes

- All filters (Date, Year, Quarter, Month, Region, Product/Service) are set to "All," so figures reflect the full unfiltered dataset across all years shown (2020–2023 on the trend axes).
- Budget Variance % is assumed to be revenue-based (actual vs. budgeted revenue); the same dashboard could alternatively define it against EBITDA or cost budgets, which would change the interpretation.
- The "Total" bar in the Cash Flow Analysis is assumed to be a separate reference figure (e.g., cumulative or prior total) rather than a recomputation of Inflow + Outflow, since 0.7M net cash and 1.4M Total do not reconcile directly from the two components shown.
- Aging buckets are read as outstanding balances at period end rather than transactions during the period; only the 0–30 and 31–60 day buckets are visible in this view, so longer-aged balances (60+ days) are not assessed here.
- Underlying currency/units are assumed consistent (M = millions, K = thousands) across all visuals, and figures are pre-tax/pre-adjustment unless the source model states otherwise.
